

FEATURES

- Four Matched PNP Transistors
- Low noise — $0.75 \text{ nV}/\sqrt{\text{Hz}}$
- High Speed — 325 MHz f_t
- Excellent Matching - 500 μV (typ)
- Dielectrically Isolated
- -25 V V_{CEO}

APPLICATIONS

- Microphone Preamplifiers
- Tape Head Preamplifiers
- Current Sources
- Current Mirrors
- Log/Antilog Amplifiers
- Multipliers

DESCRIPTION

THAT120 is a quad, large-geometry monolithic PNP transistor array which combines low noise, high speed and excellent parametric matching. The large geometry typically results in 25 Ω base spreading resistance, producing $0.75 \text{ nV}/\sqrt{\text{Hz}}$ voltage noise. This makes these parts an excellent choice for low-noise amplifier input stages.

Fabricated on a Complementary Bipolar Dielectrically Isolated process, all four transistors are electrically isolated from each other by a layer of oxide.

The resulting low collector-to-substrate capacitance produces a typical f_t of 325 MHz, for AC performance similar to 2N3906-class devices. The dielectric isolation also minimizes crosstalk and provides complete DC isolation.

Substrate biasing is not required for normal operation, though the substrate should be grounded to optimize speed. The one-chip construction assures excellent parameter matching and tracking over temperature.
