

MAS8444A

OCTAL 6-BIT TRIMMER IC

- Eight discrete DACs
- I²C-bus slave receiver
- Voltage output

DESCRIPTION

The MAS8444a comprises eight digital to analog converters (DACs) each controlled by a two-wire I²C bus. The DACs are individually programmed using an 6-bit word to select an output from one of 64 voltage

steps. The maximum output voltage of all DACs is set by V_{max}. At power-on all outputs are set to their lowest value. The I²C-bus slave receiver has 3 programmable address pins (2 in the SO16 package).

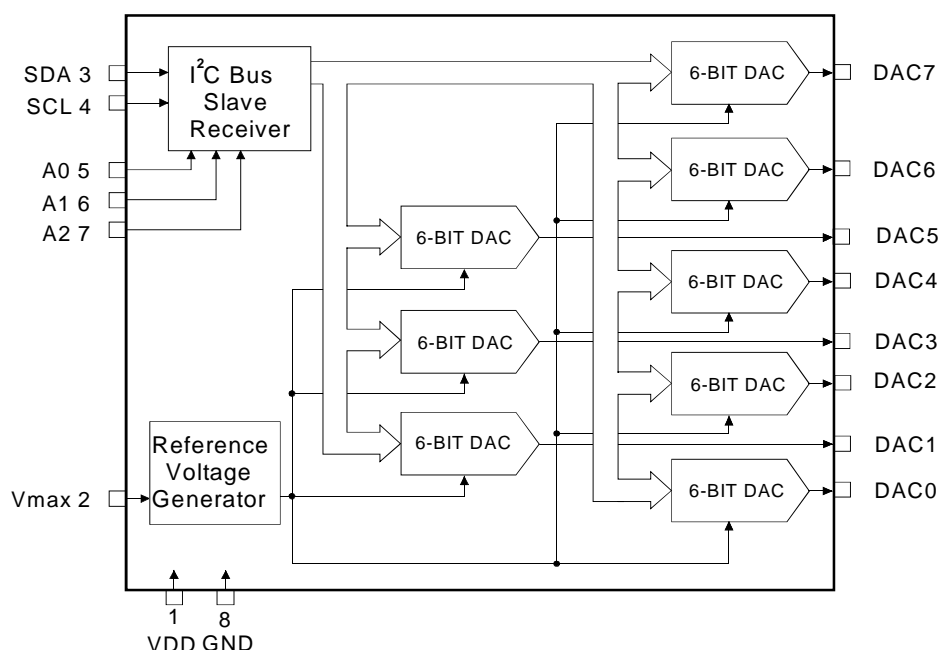

FEATURES

- Rail to rail output stages
- Octal 6-bit DACs on a single monolithic chip
- Power supply range from +5V to +12V
- -25°C to +85°C temperature range
- 16-pin PDIL and SO package
- pin to pin compatibility with TDA8444

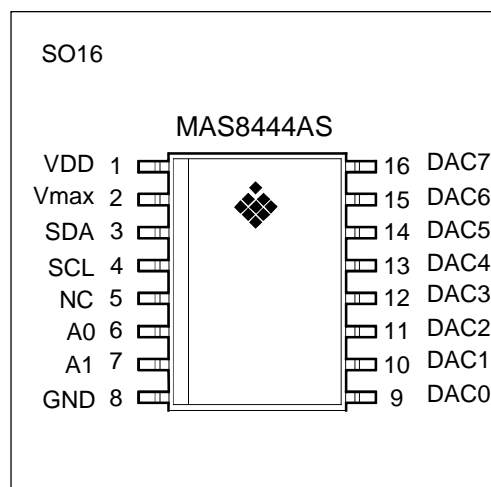

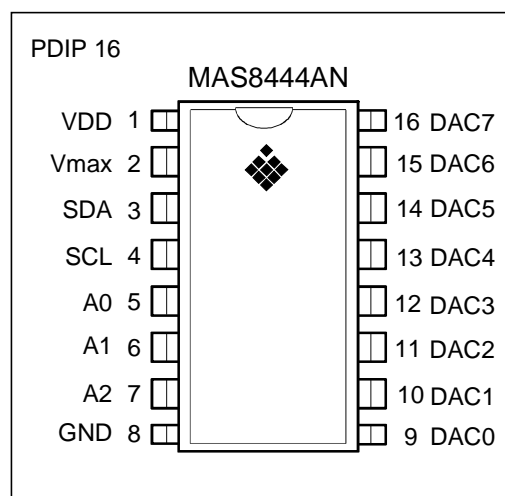

APPLICATION

- Trimmer replacement
- Automatic gain control
- High resolution monitors

FUNCTIONS

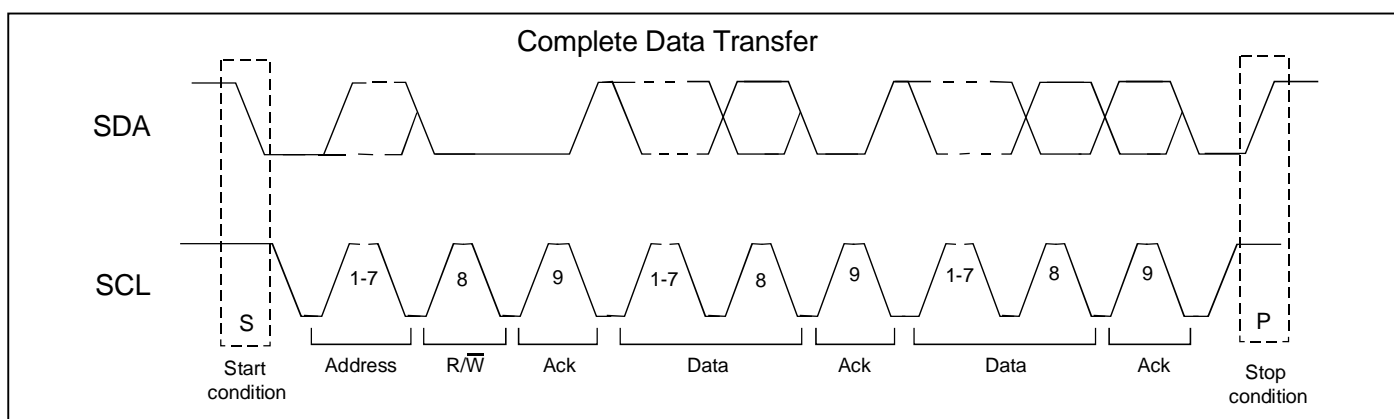

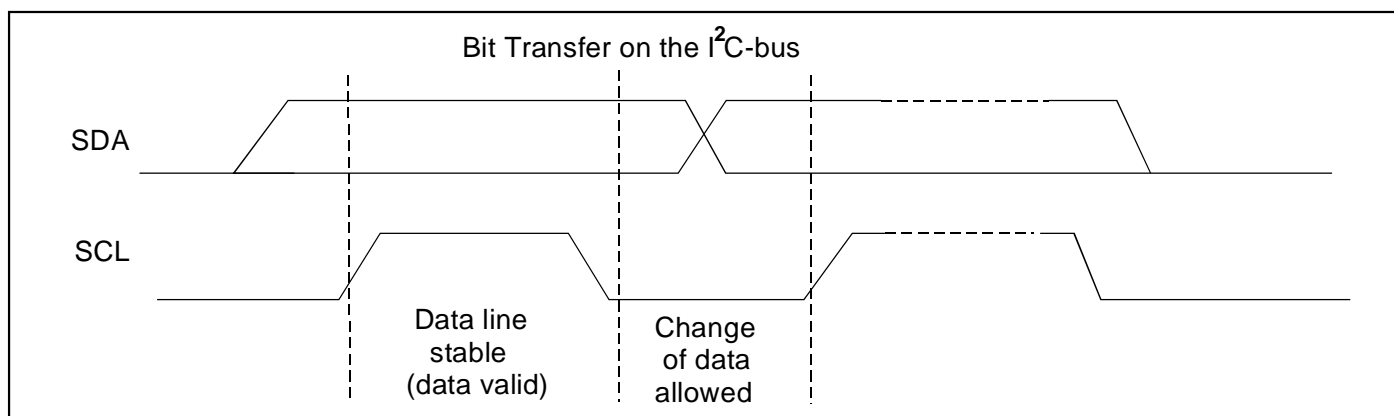

◆ I²C - bus

The MAS8444A I²C-bus interface is a receiver-only slave. Data is accepted from the I²C-bus in the following format.

S	0	1	0	0	A2	A1	A0	0	A	I3	I2	I1	I0	SD	SC	SB	SA	A	D7	D6	D5	D4	D3	D2	D1	D0	A	P

S	Start condition	A2, A1, A0	programmable address bits
P	Stop condition	I3, I2, I1, I0	instruction bits
A	Acknowledgement	SD, SC, SB, SA	sub-address bits
		D7, D6, D5, D4, D3, D2, D2, D1, D0	data bits

◆ I²C - bus timing

FUNCTIONS

◆ Address Byte

Valid addresses are 40, 42, 44, 46, 48, 4A, 4C, 4E(hex), depending on the programming of bits A2, A1 and A0. With these addresses, up to eight MAS8444A ICs can be operated independently from one I²C-bus. No other addresses are acknowledged by the

MAS8444A. The address inputs A0, A1 and A2 are programmed by connection to GND for An = 0 or to VDD for An = 1. If the inputs are left floating, An = 1 will result. For MAS8444AS, A2 is always 1.

◆ Instruction and data bytes

Valid instructions from 00 to 0F and F0 to FF (hex); MAS8444A will not respond to other instruction value, but will still generate an acknowledgement. Instructions 00 to 0F cause auto-incrementing of the sub-address (bits SD to SA) when more than one data byte is sent within one transmission. With auto-incrementing, the first data byte is written into the DAC addressed by bits SD to SA and then the sub-address is automatically

incremented by one position for the next databyte in the series. Auto-incrementing does not occur with instructions F0 to FF. Valid sub-addresses (bits SD to SA) are 0 to 7 (hex) relating numerically to DAC0 to DAC7. When the auto-incrementing function is used, the sub-address will sequence through all possible values (0 to F, 0 to F, etc.). While the sub-address is between 8 and F no DAC outputs change.

◆ I²C - bus

Input SCL (pin 4) and input/output SDA (pin 3) conform to I²C-bus specifications. Pins 3 and 4 are protected against voltage pulses by internal zener diodes

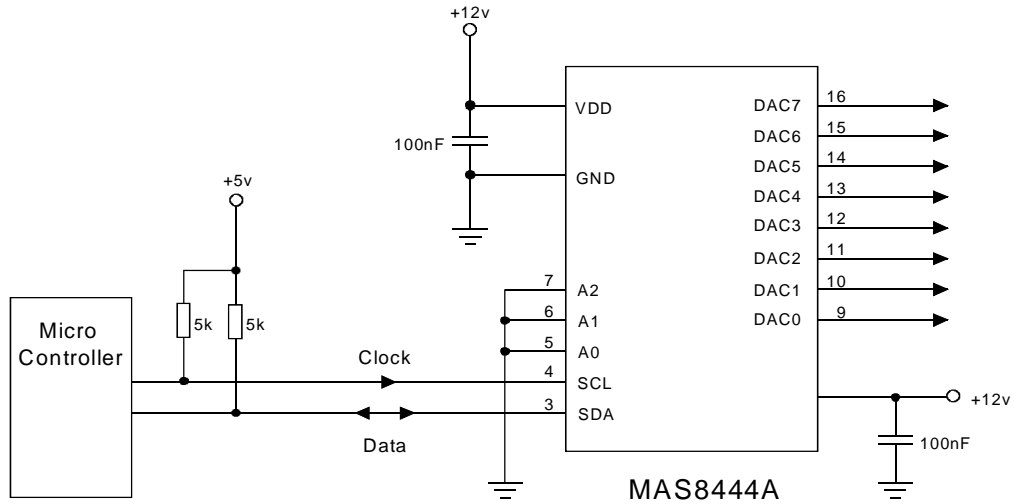

connected to the ground plane and therefore the normal bus line voltage shall not exceed 5.5v.

◆ Input Vmax

Input Vmax (pin 2) provides a means of comprising the output voltage swing of the DACs. The maximum DAC output voltage is restricted to approximately

Vmax+VDACmin while the 6-bit resolution is maintained, therefore giving a finer voltage resolution of smaller output swings.
