Description

The IR 3312(S) is a Fully Protected 4 terminal high side switch. The input signal is referenced to Vcc. When the input voltage $V_{cc} - V_{in}$ is higher than the specified V_{ih} threshold, the output power MOSFET is turned-on. When $V_{cc} - V_{in}$ is lower than the specified V_{il} threshold, the output MOSFET is turned-off. A sense current proportional to the current in the power Mosfet is sourced to the Ifb pin. Over-current shutdown occurs when $V_{ifb} - V_{in} > 4.5$ V. The current shutdown threshold is adjusted by selecting the proper RIfb. Either over-current and over-temperature latches off the switch. The device is reset by pulling the input pin high. Other integrated protections (ESD, reverse battery, active clamp) make the IR3312(S) very rugged and suitable for the automotive environment.

- 2) <500 Ohm or shorting I_{lfb} to gnd may damage the part with I_{sd} around 37A
