

Features:

- ☐ High-density 2 megabit Static RAM module
- ☐ Low profile 64-pin ZIP (Zig-zag In-line vertical Package), 64-pin SIMM or Angled SIMM (Single In-line Memory Module)
- ☐ Ultra fast access time: 10 ns (max.)
- ☐ Surface mounted plastic components on an epoxy laminate (FR-4) substrate
- ☐ Single 5V ($\pm 10\%$) power supply
- ☐ Multiple V_{SS} pins and decoupling capacitors for maximum noise immunity
- ☐ Inputs/outputs directly TTL compatible

Description:

The PDM4M4030 is a 64K x 32 static RAM module constructed on an epoxy laminate (FR-4) substrate using eight 64K x 4 static RAMs in plastic SOJ packages. Availability of four chip select lines (one for each of two RAMs) provides byte access. Extremely fast speeds can be achieved due to the use of 256K Static RAMs fabricated in Paradigm's high-performance, high-reliability CMOS technology. The PDM4M4030 is available with access times as fast as 10 ns with minimal power consumption.

The PDM4M4030 is packaged in a 64-pin FR-4 ZIP (Zig-zag In-line vertical Package), a 64-pin SIMM or Angled SIMM (Single In-line Memory Module). The ZIP configuration allows 64 pins to be placed on a package 3.65" long and 0.35" wide. At only 0.650" high, this low-profile package is ideal for systems with minimum board spacing. The SIMM configuration allows use of edge mounted sockets to secure the module.

All inputs and outputs of the PDM4M4030 are TTL compatible and operate from a single 5V supply. Full asynchronous circuitry requires no clock or refresh for operation and provides equal access and cycle times for ease of use.

Two identification pins (PD0 and PD1) are provided for applications in which different density versions of the module are used. In this way, the target system can read the respective levels of PD0 and PD1 to determine a 64K depth.

NOTE: 1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Timing Waveforms of Read Cycle No.1⁽¹⁾

Timing Waveforms of Read Cycle No.2^(1,2,4)

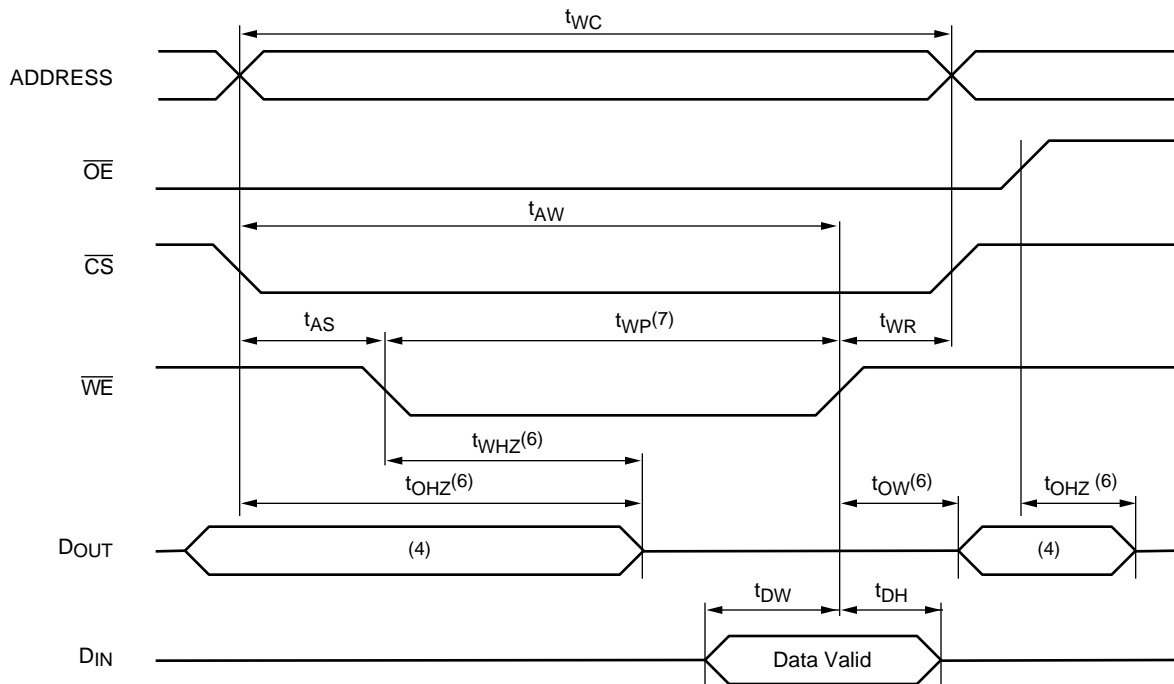

Timing Waveforms of Read Cycle No.3^(1,3,4)

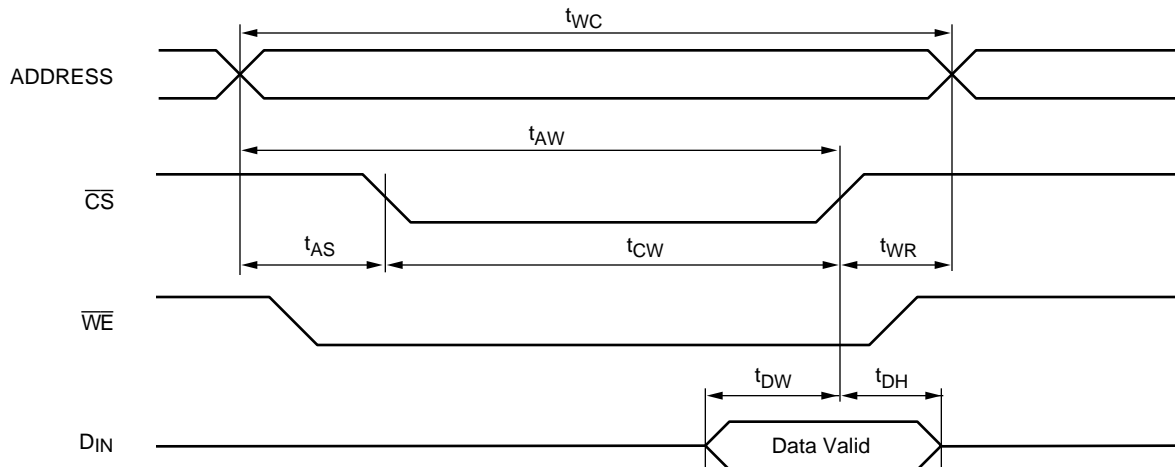

- NOTES
- \overline{WE} is HIGH for Read Cycle.
 - Device is continuously selected. $\overline{CS} = V_{IL}$.
 - Address valid prior to or coincident with \overline{CS} transition LOW.
 - $\overline{OE} = V_{IL}$.
 - Transition is measured ± 200 mV for steady state. This parameter is determined by device characteristics but is not production tested.

Timing Waveforms of Write Cycle No.1 (\overline{WE} Controlled)^(1,2,3,7)

Timing Waveforms of Write Cycle No.2 (\overline{CS} Controlled)^(1,2,3,5)

- NOTES
1. \overline{WE} or \overline{CS} must be HIGH during all address transitions.
 2. A write occurs during the overlap (t_{WP}) of a LOW CS and a LOW \overline{WE} .
 3. t_{WR} is measured from the earlier of CS or \overline{WE} going HIGH to end the write cycle.
 4. During this period, I/O pins are in the output state, and input signals must be applied.
 5. If the \overline{CS} LOW transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high-impedance state.
 6. Transition is measured ± 200 mV for steady state with a 5 pF load (including scope and jig). This parameter is determined by device characteristics but is not production tested.
 7. If \overline{OE} is LOW during a \overline{WE} controlled write cycle, the write pulse width must be the larger of t_{WP} or ($t_{WHZ} + t_{DW}$) to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW} . If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the write pulse width can be as short as the specified t_{WP} .
