

AC LINE FREQUENCY DIVIDERS

July 2000

RED SERIES

RED 5/6	Divide by 5 or 6
RED 50/60	Divide by 50 or 60
RED 100/120	Divide by 100 or 120
RED 300/360	Divide by 300 or 360
RED 500/600	Divide by 500 or 600
RED 3000/3600	Divide by 3000 or 3600

FEATURES:

- Clock input pulse shaper accepts 50Hz/60Hz sine wave directly
- Fully static counter operation
- +4.5V to +15V operation (VDD-Vss)
- Low power dissipation
- High noise immunity
- Reset
- Input Enable
- 50Hz/60Hz division select input
- Output low power TTL compatible at +4.5V operation
- Square Wave Output (except for ÷ 5)
- RED x/y (DIP); RED x/y-S (SOIC) See Figure 1

APPLICATION:

Time base generator from either 50 Hz or 60 Hz line frequency to produce:

10 pulses per second	(RED 5/6)
1 pulse per second	(RED 50/60)
1 pulse per 2 seconds	(RED 100/120)
1 pulse per .1 minute	(RED 300/360)
1 pulse per 10 seconds	(RED 500/600)
1 pulse per minute	(RED 3000/3600)

DESCRIPTION OF OPERATION:

The counter advances by one on each negative transition of the input clock pulse as long as the Enable signal is High and the Reset signal is Low. When the Enable signal is Low the input clock pulses will be inhibited and the counter will be held at the state it was in prior to bringing the Enable Low. A High Reset signal clears the counter to zero count.

Depending on the device used, a Low on the Division Select input will cause a Divide by 6, 60, 120, 360, 600 or 3600. A High on the Division Select will cause a Divide by 5, 50, 100, 300, 500 or 3000.

All outputs are 50% duty cycle except RED 5, where output is low for two clocks and high for three clocks.

CLOCK INPUT

If input signals are less than the Vss or greater than VDD, a series input resistor should be used to limit the maximum input current to 2 mA.

ENABLE SIGNAL TIMING

If the Enable signal switches Low during a positive clock phase and then switches High during a negative clock phase, a false count will be registered. To prevent this from happening, the Enable signal should not switch Low during a positive clock phase unless the switch to High also occurs during a positive clock phase. The Enable signal should normally be switched during a negative clock phase.
